It currently consists of 19 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Submitted (13-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA ON May 13, 2003 this sequence version replaced gi:23321447.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlass (http://www.hgsc.bcm.tmc.edu/projects/rat/). Bach contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence. It currently consists of 11 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and separated

NOTE: This is a "working draft" sequence. It currently consists of 66 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Web site: Now. sanger.ac.uk Contract: 2fish-hepsanger.ac.uk Contract: 2fish-hepsanger.ac.uk Contract: 2fish-hepsanger.ac.uk During sequence assembly data is compared from overlapping clones. Where differences are found these are amnotated as variations where differences are found these are amnotated as variations repared with a note of the overlapping clone, as we submit sequence submission corresponding to the overlapping clone, as we submit sequence with any a small overlap as described above. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality = 10) an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by all compared on plasmid subclone or more than one MI3 subclone; and the assembly was confirmed by restriction digest, except on the rare cocasion of the clone being YNC: on such constant of the clone being YNC: on seasons of the clone being YNC: on the WORNERP information on the WORNERP database can be found at the feature table with their source databases: numbers given in the feature table with their source databases: mumbers diversing abbreviating abbreviation and the clone being the feature found at the proper accession on the WORNERP database can be found the longest sociationally display inconsistency over the this is found the longest sociationally display inconsistency over the submitted. Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Redy) submitted. Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Redy) submitted. Repeat names beginning 'Dr' were identified by Richemisted, and those beginning 'dr' were identified by Richemisted, where the beginning 'dr' were identified by Richemisted, where the beginning 'dr' were identified by Richemisted, where the beginning 'dr' were identified by	Alignment Scores: Alignment Scores: Score: Score: 31.50 Matches: Connervative: 32.48 Connervative: Best Local Similarity: 25.94 Mismatches: 43 Ouery Match: 55.94 Mismatches: 77 Gaps: US-10-015-388A-54 (1-280) x BX569781 (1-170138) Oy 49 AspAsnAlaProValValAspGlnGlnLeuLeuTyThrCyaCyPsProTyrlle
